Leading public players in humanoid robotics face a growing network of innovative startups

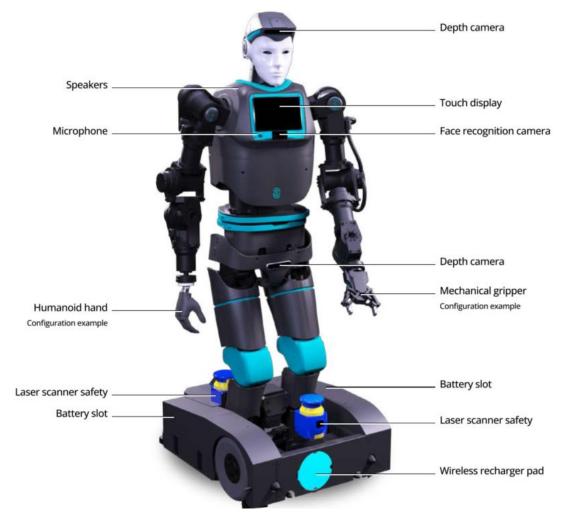

RoBee [™]: the new frontier of Al

RoBee is the result of the founders' idea to make available to companies technological systems capable of harnessing **the potential of cognitive** artificial intelligence. Its use makes it possible to support workers in the performance of hard and hazardous tasks.

Height (variable between) 135-200 cm Weight (depending on configuration) Up to 120 kg Floor space 65 cm - 39° of freedom Operational autonomy 8 hours Charging (induction) 90 minutes Operating range

5° C / 50° C

MedBee [™]: the evolution of RoBee [™]

MedBee represents the evolution of RoBee, adapted and enhanced specifically for the health industry.

MedBee aims to be the revolution in supporting physicians in patients care and rehabilitation.

Height (variable between)

120-165 cm

Weight (depending on configuration)

Less than 75 kg

Footprint

35 x 45 cm

Operational autonomy

Up to 8 hours

Connectivity

Wireless, WiFi 6, 5G ready

Operating range

5° C / 50° C

What

Cognitive social humanoid robot designed to provide support in neurorehabilitation activities and applications in the medical and healthcare fields

Why (Dilemma)

The aging population and the shortage of healthcare personnel

The solution

MedBee is capable of **assisting and supporting healthcare personnel in hospitals**, particularly in the **motor and cognitive rehabilitation process for stroke** patients

The product

Features of MedBee:

- Recognizes objects and people, interacts with the environment, and collects and processes information for patient care and rehabilitation
- MedBee is an empathetic and social robot, placing interaction with the patient at the center as it is fundamental for providing effective care and reducing hospitalization and rehabilitation times

How

- · Teaches and helps patients perform exercises for motor and cognitive recovery
- Collects and analyzes data to facilitate medical staff's decisions

RoBee [™]: Key Features

Computer vision

Thanks to advanced vision systems, it is capable of autonomously recognizing objects and individuals

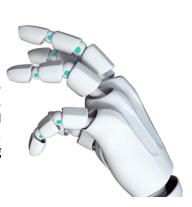

The **voice command** device makes it capable of interacting and **conversing** with people even in different languages

Manipulation

Its gripping elements, including a humanoid hand, mechanical grippers and pneumatic end effectors, make it ideal for performing various tasks

Remote control

Data Analytics

RoBee, which can be linked to the company management system, collects and processes data via artificial intelligence, enabling the company to optimise production and plan key processes

AMR navigation

With three cameras, the aid of an advanced sensor system for space mapping and omnidirectional wheels, RoBee is capable of moving autonomously in safety

The applications of RoBee ™

RoBee's technical features make it **flexible** and **adaptable** to different environments, making it a viable solution in a **variety of sectors**, including:

Mechanical industry

It can be used to **pick up, mount** and **assemble** objects in situations where **maximum** precision is required.

Logistics

The cognitive capabilities of RoBee make it capable of performing stock and picking operations of goods completely autonomously.

Chemical industry

It can carry out inspections Inside potentially chemical contaminated areas with the help of optical sensors that detect environmental parameters.

Industrial automation

It can be put at the service of **numerical control** and **co-ordinate** machines with part loading and unloading functions, **automating** their activity.

Medical

Significant investments have been made by the company to implement RoBee in the medical field, assisting doctors and healthcare professionals in rehabilitation therapies.

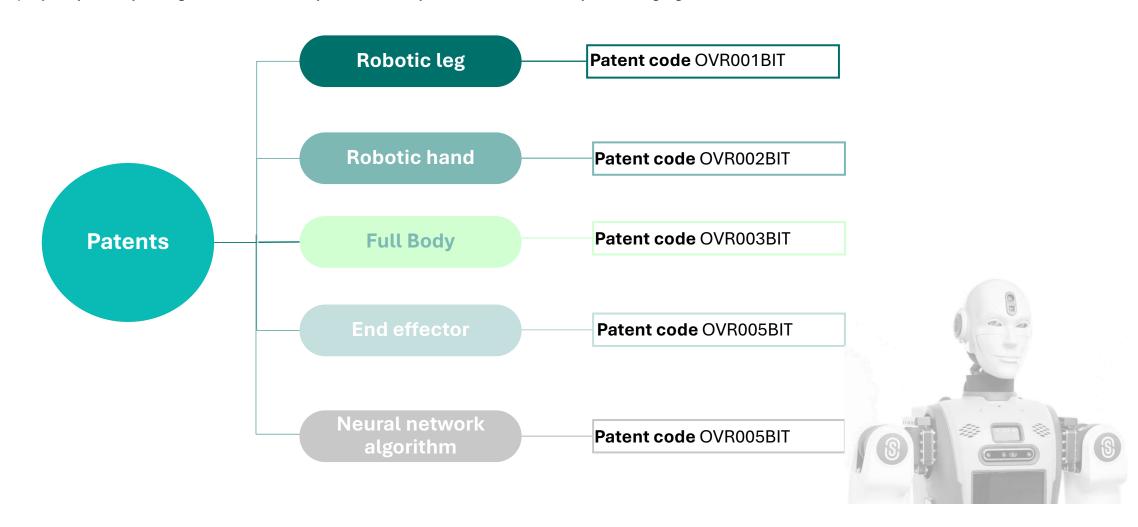

Electronics industry

Suitable for applications involving the handling of printed circuit boards and electronic cards. Moreover, thanks to the end effectors, it can perform picking and handling operations on small components.

Patents

In addition to **the international registration of the Oversonic brand** on 23 March 2022, in order to consolidate its competitive advantage, the company has **patents pending** for some of the **components developed** and **installed on the product**, highlighted below:

CERTIFICATION ISO/TS 15066

ISO/TS 15066 provides safety requirements and guidelines for the design, integration, and use of collaborative robots (cobots). Cobots are robots designed to work safely alongside humans in a shared workspace.

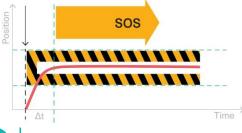

CERTIFICATION ISO/TS 14971 FDA-MDR

This standard regulates risk management for medical devices. The safety concept is developed top-down and application-related safety limits are defined for the worst-case scenario. Common examples are

- Maximum forces on the patient
- Permissible ranges of movement or
- Deviations from target positions To comply with the defined limit values, the safety functions of the SensoJoint Safe can be used.

STO, SS1, SS2, SOS, SLS, SMS, Safe Velocity, Safe Position, Safe Torque

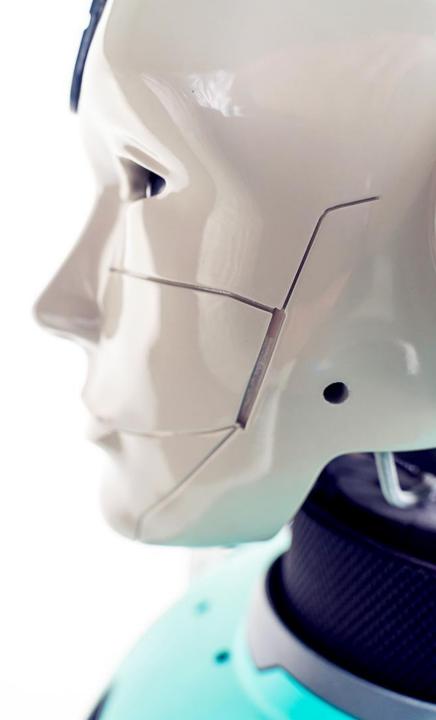

DEGREE OF PROTECTION IP 65

The IP65 degree of protection is an international code defined by the IEC 60529 standard that classifies the level of protection provided by an enclosure (such as that of an electronic device or equipment) against the ingress of solid foreign bodies and liquids.

USING ROBEE IN CLEAN ROOMS ISO6

The primary goal is to ensure that the device does not introduce, generate, or retain particles, microorganisms, or other forms of contamination that could compromise the purity of the cleanroom environment and the quality of the products or processes that take place there.

CERTIFICATION ATEX 2/22

ATEX certification is a mandatory certification for devices intended for use in potentially explosive environments. ATEX is the acronym for "ATmosphères EXplosibles", a set of European Union directives that establish safety and health requirements for the use of electrical and mechanical equipment in environments with potentially explosive atmospheres

gios,
Allargato l'orizzonte oltre l'emergenza
pandemica, ora l'azienda pensa di con-centrarsi su due grandi settori per i pro-pri prodotti: la smart industry e l'ambito medico. Denti fa un esempio concreto: «Il robot umanoide si inserisce in un lavoro laddove ci sono delle fasi del proce produttivo che oggi implicano delle co dizioni rischiose per la salute degli oper tori umani, come il dover gestire mate li pericolosi o agenti chimici. Penso un'azienda con cui stiamo dialogano che ha un processo di verniciatura componenti plastiche totalmente rob tizato, ma in cui il carico e scarico di que ste macchine viene fatto da un operatore che respira un'aria molto pesante: stia-mo valutando come queste fasi possano essere svolte da robot umanoidi».

A soli due anni dall'avvio l'azienda ha ora già incassato i primi ordini delle aziende italiane, e stretto un'importante partnership con l'americana Barrett Technology, costola del MIT di Boston, Il

SENSORIZED SKIN FOR HUMANOID ROBOTS - FBG SENSORS(1)

Objective: To create a soft, scalable artificial skin for robots that enables safe physical interaction with humans in unstructured environments.

Technology: The skin is biomimetic, using **Fiber Bragg Grating (FBG)** sensors integrated into a soft polymeric matrix.

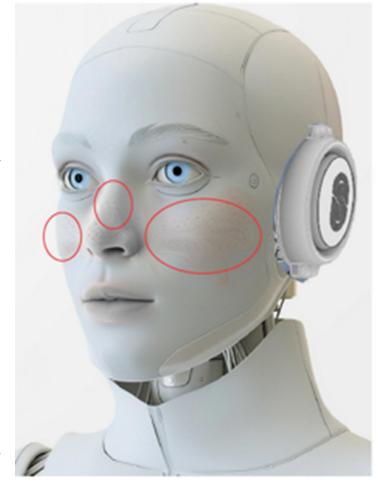

Functionality: The FBG sensors mimic human tactile receptors, specifically Ruffini mechanoreceptors, which have diffuse, overlapping receptive fields.

Data Processing: A **deep learning algorithm (CNN)** decodes the sensor data to precisely infer the force and location of a contact.

Advantages: FBG technology allows multiple sensors to be integrated onto a single optical fiber, minimizing cabling and simplifying wiring management.

Results: The system demonstrated a median error of **35 mN** for force prediction and **1.2 mm** for contact localization.

Outlook: Integrating this technology with AI will pave the way for new collaborative behaviors, such as robot path reprogramming/collision avoidance or manipulation and grasping.

IMPROVED ONBOARD COMPUTING POWER

Core System and Performance Enhancements

- Processor Upgrade: Migrated from an i7 to a top-tier i9 Core processor, delivering a significant boost in raw computing power and multi-tasking capabilities.
- Massive RAM Increase: System memory has been expanded by five times (5x), enabling seamless handling of massive datasets and extremely demanding applications.
- Enhanced Power Efficiency: Achieves a substantial performance increase while simultaneously reducing battery consumption, optimizing power for longer operational use.

GPU and AI Acceleration

- Next-Generation GPU Architecture: Features the cutting-edge NVIDIA Blackwell GPU, equipped with 2560 cores and 96 fifth-generation Tensor Cores.
- Advanced AI Performance: Delivers over 2000 TOPS at FP4 precision, providing unprecedented acceleration for artificial intelligence and machine learning workloads.
- Multi-Instance GPU (MIG): Integrated MIG capability with 10 TPCs (Tensor Processing Clusters) allows the GPU to be partitioned into multiple, isolated instances to run diverse workloads in parallel.

Connectivity and Thermal Management

- High-Speed Data Transfer: Upgraded with advanced connectors and data acquisition technology to support bandwidth up to 40 GB/s, dramatically improving communication speed with all peripherals.
- Superior Thermal Dissipation: The cooling system has been redesigned with larger heatsinks for significantly improved heat dissipation, ensuring sustained peak performance under heavy loads.

HOW TO PERFORM TASKS

- To Match the use case we need:
- Cycle Time ->
 Acceptable up to 3 times
 human speed
- Robustness ->Changes in the scenario
- Accuracy -> Typically not less than 3mm

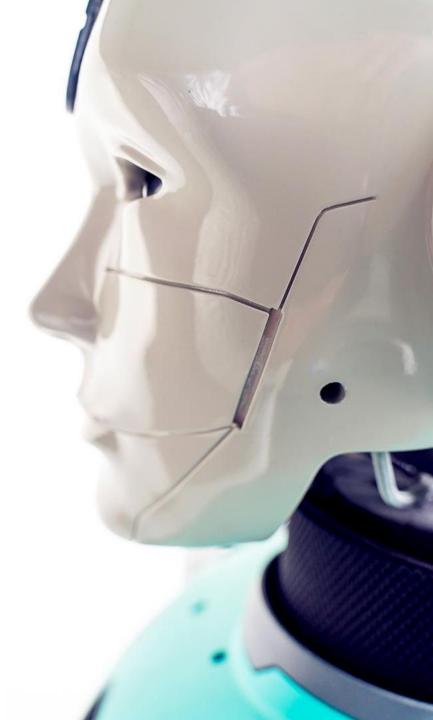

To match cycle time

Pre-Recorded Trajectories

<u>R</u>

Planned cognitive based Trajectories

HOW TO PERFORM TASKS

- Metrics for Trajectory Precision and Reactivity
- Focus on precise navigation and response to
- unexpected events
- Key Areas:
- Trajectory tracking precision
- Dynamic stability during motion
- Reactivity to external perturbations
- Quantitative evaluation framework (CYCLETIME)

INTRODUCTION AND OBJECTIVES

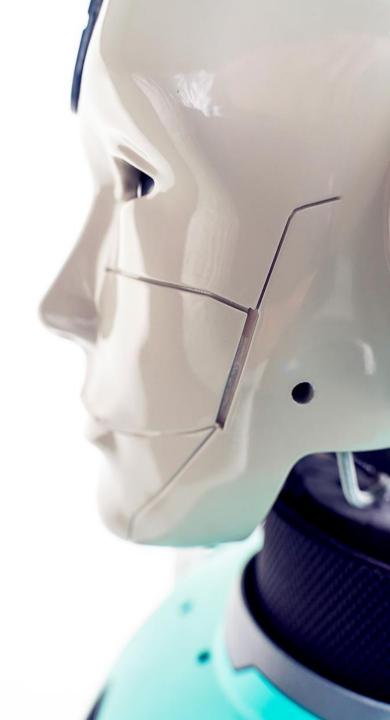

Challenges in Bipedal Robotics

- 1. Dynamic stability
- •Balance maintenance during motion
- •Center of Mass (CoM) management
- 2. Kinematic precision
- Accuracy in following predefined trajectories
- Coordinated multi-joint control
- 3. Adaptability
- Ability to react to external perturbations
- Adaptation to varying terrains
- 4. Energy efficiency
- Motion consumption optimization
- •Performance vs. energy trade-offs

Evaluation Objectives

- ✓ Quantify precision: Measure how accurately the robot follows planned trajectories
- ✓ Assess reactivity: Determine speed and effectiveness of response to unexpected events

TRAJECTORY PRECISION METRICS INVOLVING NAVIGATION

1. Position Error

Euclidean distance between desired and actual position

Formula:

 $PE(t) = ||p_desired(t) - p_actual(t)||_2$

Variants:

•RMSE (Root Mean Square Error): $\sqrt{(1/N \sum (PE(t)^2))}$

•MAE (Mean Absolute Error): 1/N ∑|PE(t)|

• **Maximum Error:** max(PE(t))

2. Orientation Error

Definition: Angular difference between desired and actual orientation

Formula:

 $OE(t) = arccos((trace(R_desired^T \cdot R_actual) - 1) / 2)$

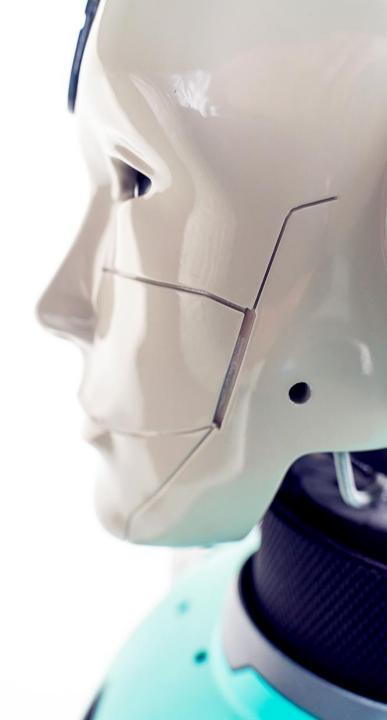

Importance: Critical for tasks requiring precise body or end-effector orientation

3. Dynamic Time Warping (DTW)

Usage: Comparison between trajectories with temporal differences **Advantages:**

- Robust to speed variations
- Evaluates overall trajectory shape
- Independent of temporal shifts

STABILITY AND BALANCE METRICS

1. Zero Moment Point (ZMP)

Definition: Point on the ground where the total moment of reaction forces is zero

Formula:

 $ZMP_x = (\sum m_i \cdot (g + \ddot{x}_i) \cdot x_i - \sum m_i \cdot \ddot{y}_i \cdot z_i) / \sum m_i \cdot (g + \ddot{z}_i)$

Stability criterion: ZMP must remain within the support polygon

Metric: Minimum distance from ZMP to support polygon edge (stability margin)

2. Capture Point (CP)

Definition: Point where the robot must place its foot to arrest motion

REACTIVITY METRICS FOR UNEXPECTED EVENTS

1. Response Time

Definition: Interval between event detection and motor response initiation

Formula:

T_response = T_action_start - T_event_detection

Components:

•Sensing delay: ~10-30 ms

•Processing delay: ~20-50 ms

Actuation delay: ~30-70 ms

2. Recovery Time

Definition: Time needed to return to stable state after perturbation

Formula:

T_recovery = T_stable - T_perturbation

Recovered stability criteria:

•ZMP within safety margins (>10% of polygon)

•Trunk angular velocity < 0.1 rad/s

•CoM oscillations < 0,8 cm amplitude

3. Perturbation Robustness

Push Recovery Metric: Maximum tolerable push force without falling

Disturb Rejection Ratio:

DRR = |F_max_tolerated| / |F_nominal|

CASE STUDY - COMPARATIVE EVALUATION

Test Scenario

Task: Navigation in environment with obstacles and random perturbations **Robots tested:**

3 different control configurations **Trials:** 100 per configuration **Environment:** 10m x 10m with 5 static obstacles, 2 dynamic

Key Metrics Results

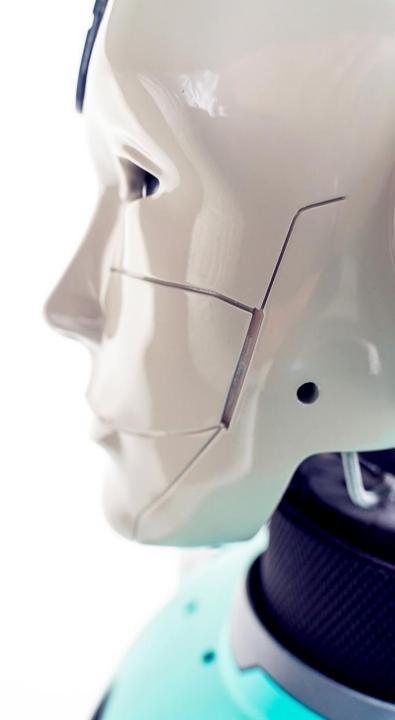

Results Analysis

Config C - Best overall performance:

- ✓ Higher tracking precision (35% better than A)
- ✓ Faster recovery from perturbations (33% faster)
- ✓ Better energy efficiency (6% more efficient)

Metric	Config A	Config B	Config C
Position RMSE (Mm)	2.3 ± 0.4	1.8 ± 0.3	1.5 ± 0.2
Response Time (ms)	120 ± 15	95 ± 10	105 ± 12
Recovery Time (s)	1.8 ± 0.3	1.5 ± 0.2	1.2 ± 0.2
Success Rate (%)	85%	91%	99%
СоТ	0.48	0.52	0.45
Max Push Tolerated (N)	80	85	95
